Public health:

a new priority in transport policy

Philip Insall
Director, International, Sustrans
Transport policy is bad for public health
Europeans are inactive and unhealthy

“Two thirds of the adult population in the European Union do not reach recommended levels of activity”

Physical activity and health in Europe: evidence for action, WHO 2006
We have built obesogenic environments
Motorisation linked to obesity

obesity risk 80% higher in motor-owning households

men acquiring a motor vehicle doubled their obesity risk

Bell, Ge and Popkin, 2002, in Obesity Research
... obesity is only part of the problem

physical inactivity increases heart disease risk...

... and type II diabetes...

... many forms of cancer...

... mental illnesses

... other health impacts

€ billions in healthcare
There is a weight of evidence

Go to www.sustrans.org.uk/what-we-do/active-travel

…. for evidence based information sheets on active travel and health

…. and The Evidence! – a listing of heavyweight academic papers
We should have built for healthy living
Consensus in favour of active travel

“The top five policy responses assessed as having the greatest average impact on levels of obesity [include]:

- increasing walkability / cyclability of the built environment…..”

Consensus in favour of active travel

“Urban planners ..... need to integrate health and active living considerations fully into their work...

... transport officials can provide a balanced transport system that enables residents to walk or cycle to shops, school and work.”

*Promoting physical activity and active living in urban environments, World Health Organisation, 2006*
“For most people, the easiest and most acceptable forms of physical activity are those that can be incorporated into everyday life. Examples include walking or cycling instead of travelling by car.....”

At least five a week; the Chief Medical Officer’s report on physical activity, 2004
Consensus across sectors

“Planning authorities should ensure new development is located where everyone can access services or facilities on foot, bicycle or public transport rather than having to rely on access by car.”

ODPM 2005, Planning Policy Statement 1: Delivering Sustainable Development
“opportunities must be taken within the planning process to make cycling, walking and public transport the modes of choice. These modes must be made more convenient for the majority of journeys than car usage, in order to promote genuine modal shift”

DfT 2008, Building Sustainable Transport into New Developments
Explicit guidance from health world

From National Institute for Health and Clinical Excellence (NICE)
Explicit guidance from NICE

- local facilities and services easily accessible on foot, by bicycle
- re-allocate road space from car to active travel
- restrict motor vehicle access (for example, by closing or narrowing roads to reduce capacity)
- road-user charging schemes
- traffic-calming to restrict vehicle speeds
- safe routes to schools
- provide a comprehensive network of routes for walking, cycling
Health and other policy sectors all now agree: we need to promote walking and cycling

Consensus in favour of active travel

So how do we make it happen?
Mobility... or accessibility?

• Transport policy has prioritised *mobility*: the ability to travel – sometimes long distances
Mobility . . . or accessibility?

- **Accessibility**: access to the goods and services people need
- **the ideal is maximum accessibility with minimum mobility**
Analysis of travel behaviour shows very significant potential for change to more active modes
## Constants in travel behaviour

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily mobility</td>
<td>On average, people make three trips per day, spending one hour travelling</td>
</tr>
<tr>
<td>Activities</td>
<td>Only one in five trips is work-related</td>
</tr>
<tr>
<td>Spatial orientation</td>
<td>Five out of six trips begin or end at home</td>
</tr>
<tr>
<td>Car trips</td>
<td>10% are not further than 1km, 30% are not further than 3km and 50% are not further than 5km</td>
</tr>
</tbody>
</table>
Potential for sustainable travel modes

% trips per person: Sustainable Travel Demonstration Towns

Circumstances enforce car use

Actual usage (walking, cycling, public transport)

Socialdata
Potential for sustainable travel modes

% trips per person: Sustainable Travel Demonstration Towns

- No adequate alternative: 27%
- Actual usage (walking, cycling, public transport): 35%
- Circumstances enforce car use: 9\%
Potential for sustainable travel modes

% trips per person: Sustainable Travel Demonstration Towns

- Actual usage (walking, cycling, public transport) 35%
- Only subjective reasons against walking, cycling, public transport 29%
- No adequate alternative 27%
- Circumstances enforce car use 9%

Socialdata
Potential for sustainable travel modes
without significant environmental modification

Immediate potential for walking, cycling & public transport

Environmental factors “enforce” private motorised modes

64

Potential for sustainable travel modes
with environmental intervention
Mode choice in Basel, Switzerland

% trips per person

Motorised private modes

Walking, cycling & public transport

Socialdata

SuTrans
So, what to do?

Transfer priority away from motor traffic
Walking and cycling networks

Before housing or commercial building begins, high quality walking and cycling routes are built, Bilbao
Comprehensive walking and cycling networks

Nordrhein-Westfalen, Germany
Traffic restraint

Smart access control to urban centre using rising bollards, Tolosa (Spain)
Convenient, direct active travel routes

Two-way cycling on one-way streets is standard in most cycle-friendly cities (London)
Re-allocate road space from the car

Restricts private motor transport and facilitates active travel (London)
Safe routes to schools

The best SRS interventions often capture road space from the car (Ipswich, UK)
Road user charging

Significant, long-term, incremental..... helps people plan their lives (London, still the best example)
Leadership and example
Joint policy call

Public health, transport, social and other organisations in concert

Take action on active travel

Why a shift from car-dominated transport policy would benefit public health

For the first time, the UK’s leading organisations working on all areas of public health, including those who shape the environment we live in, have come together to give government our expert views on active travel and health ....
Take action on active travel

• set ambitious targets for a growth in walking and cycling – and ensure they are met
• invest at a realistic level – 10% of transport budgets immediately
• create safe, attractive walking and cycling conditions
• make 20mph or lower speed limits the norm for residential streets
• tackle bad driving
• “health check” every transport and land use decision

and finally...

This presentation is about public health, but the benefits of a shift to active travel go much wider
Reduce car use
reduce car use

more physical activity - lower risk of obesity, heart disease & diabetes

lower C02 emissions - and savings in precious fuels

safer roads & public spaces - better for communities and can help reduce accidents

Based on: Faculty of Public Health, 2008, Sustaining a Healthy Future
