LEVITATE – Passenger car use case

Event: Mobilising Mobility: Impact assessment of automated vehicles

Location: Online

Date: 15th October 2020

levitate

LEVITATE has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 824361.

LEVITATE

Societal Level Impact of Connected and Automated Vehicles

€ 6,4 million project funded by the European Commission under the Horizon 2020 research framework programme

Project coordinator: Loughborough University

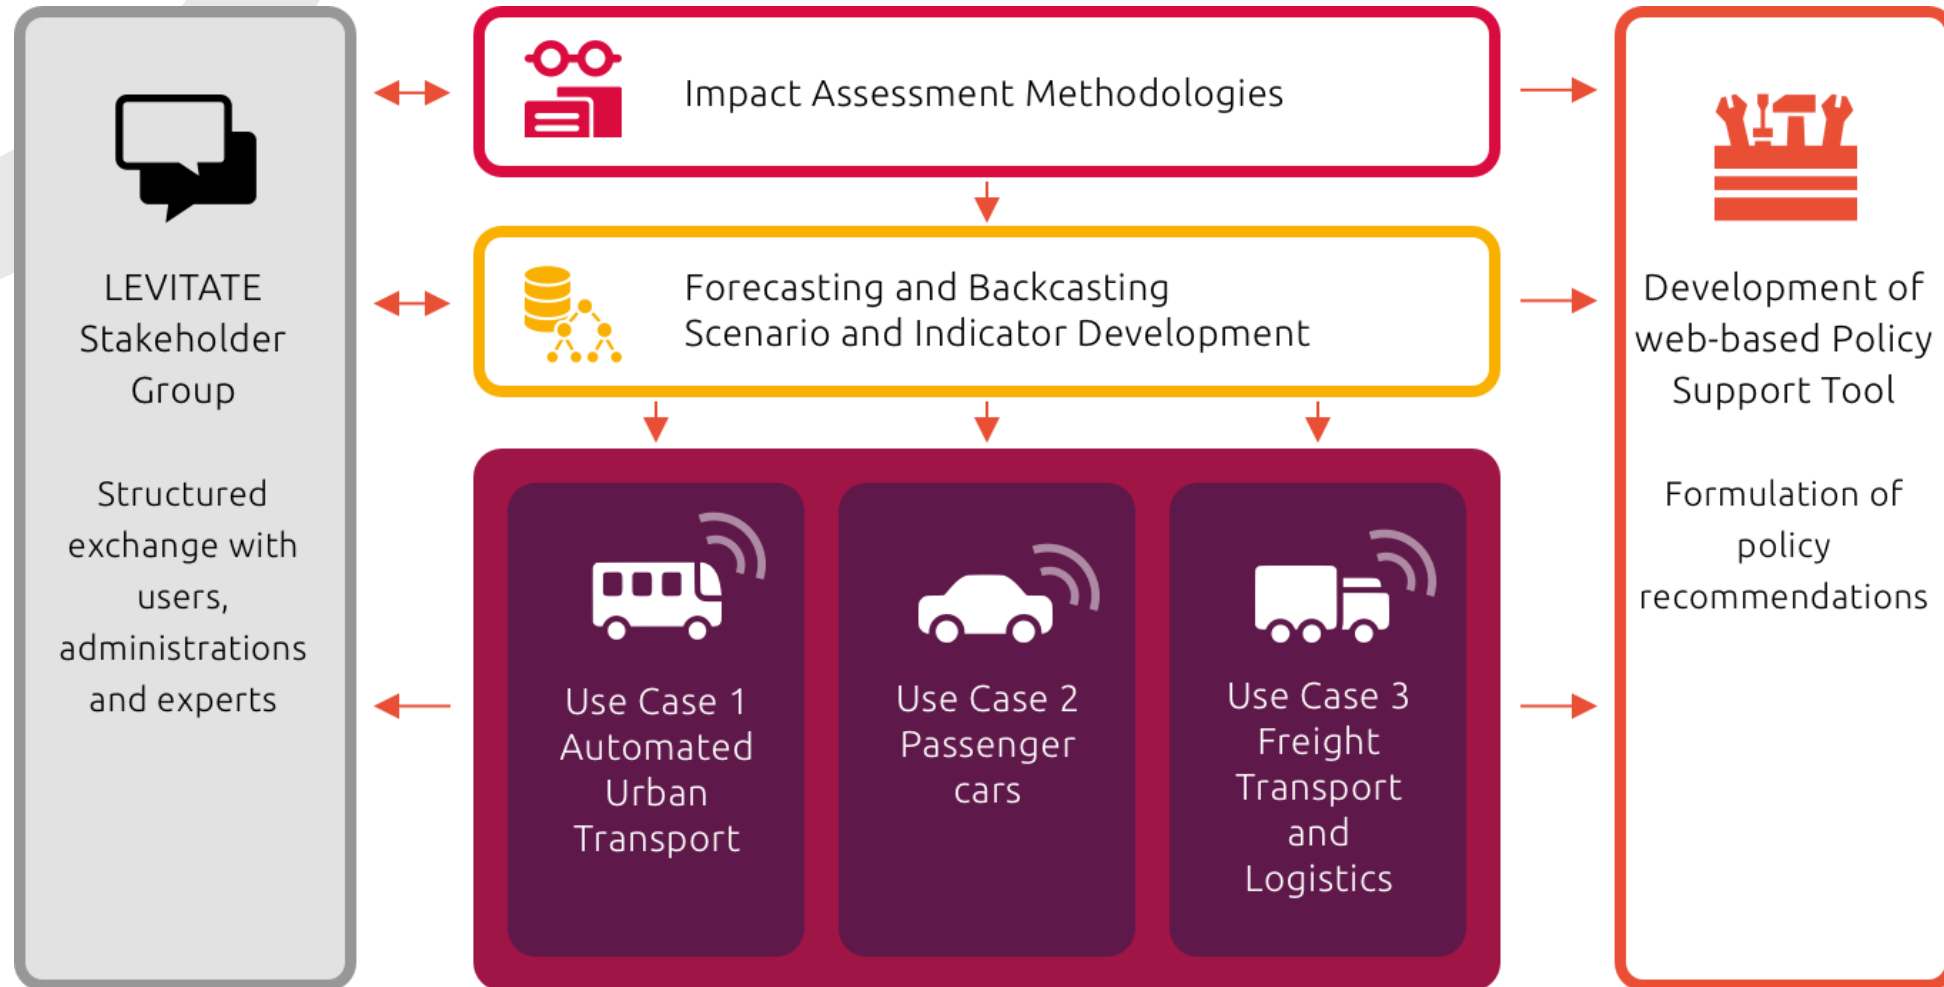

Start date: 1st of December, 2018 – 3 years

Partners: 12 – from 10 countries

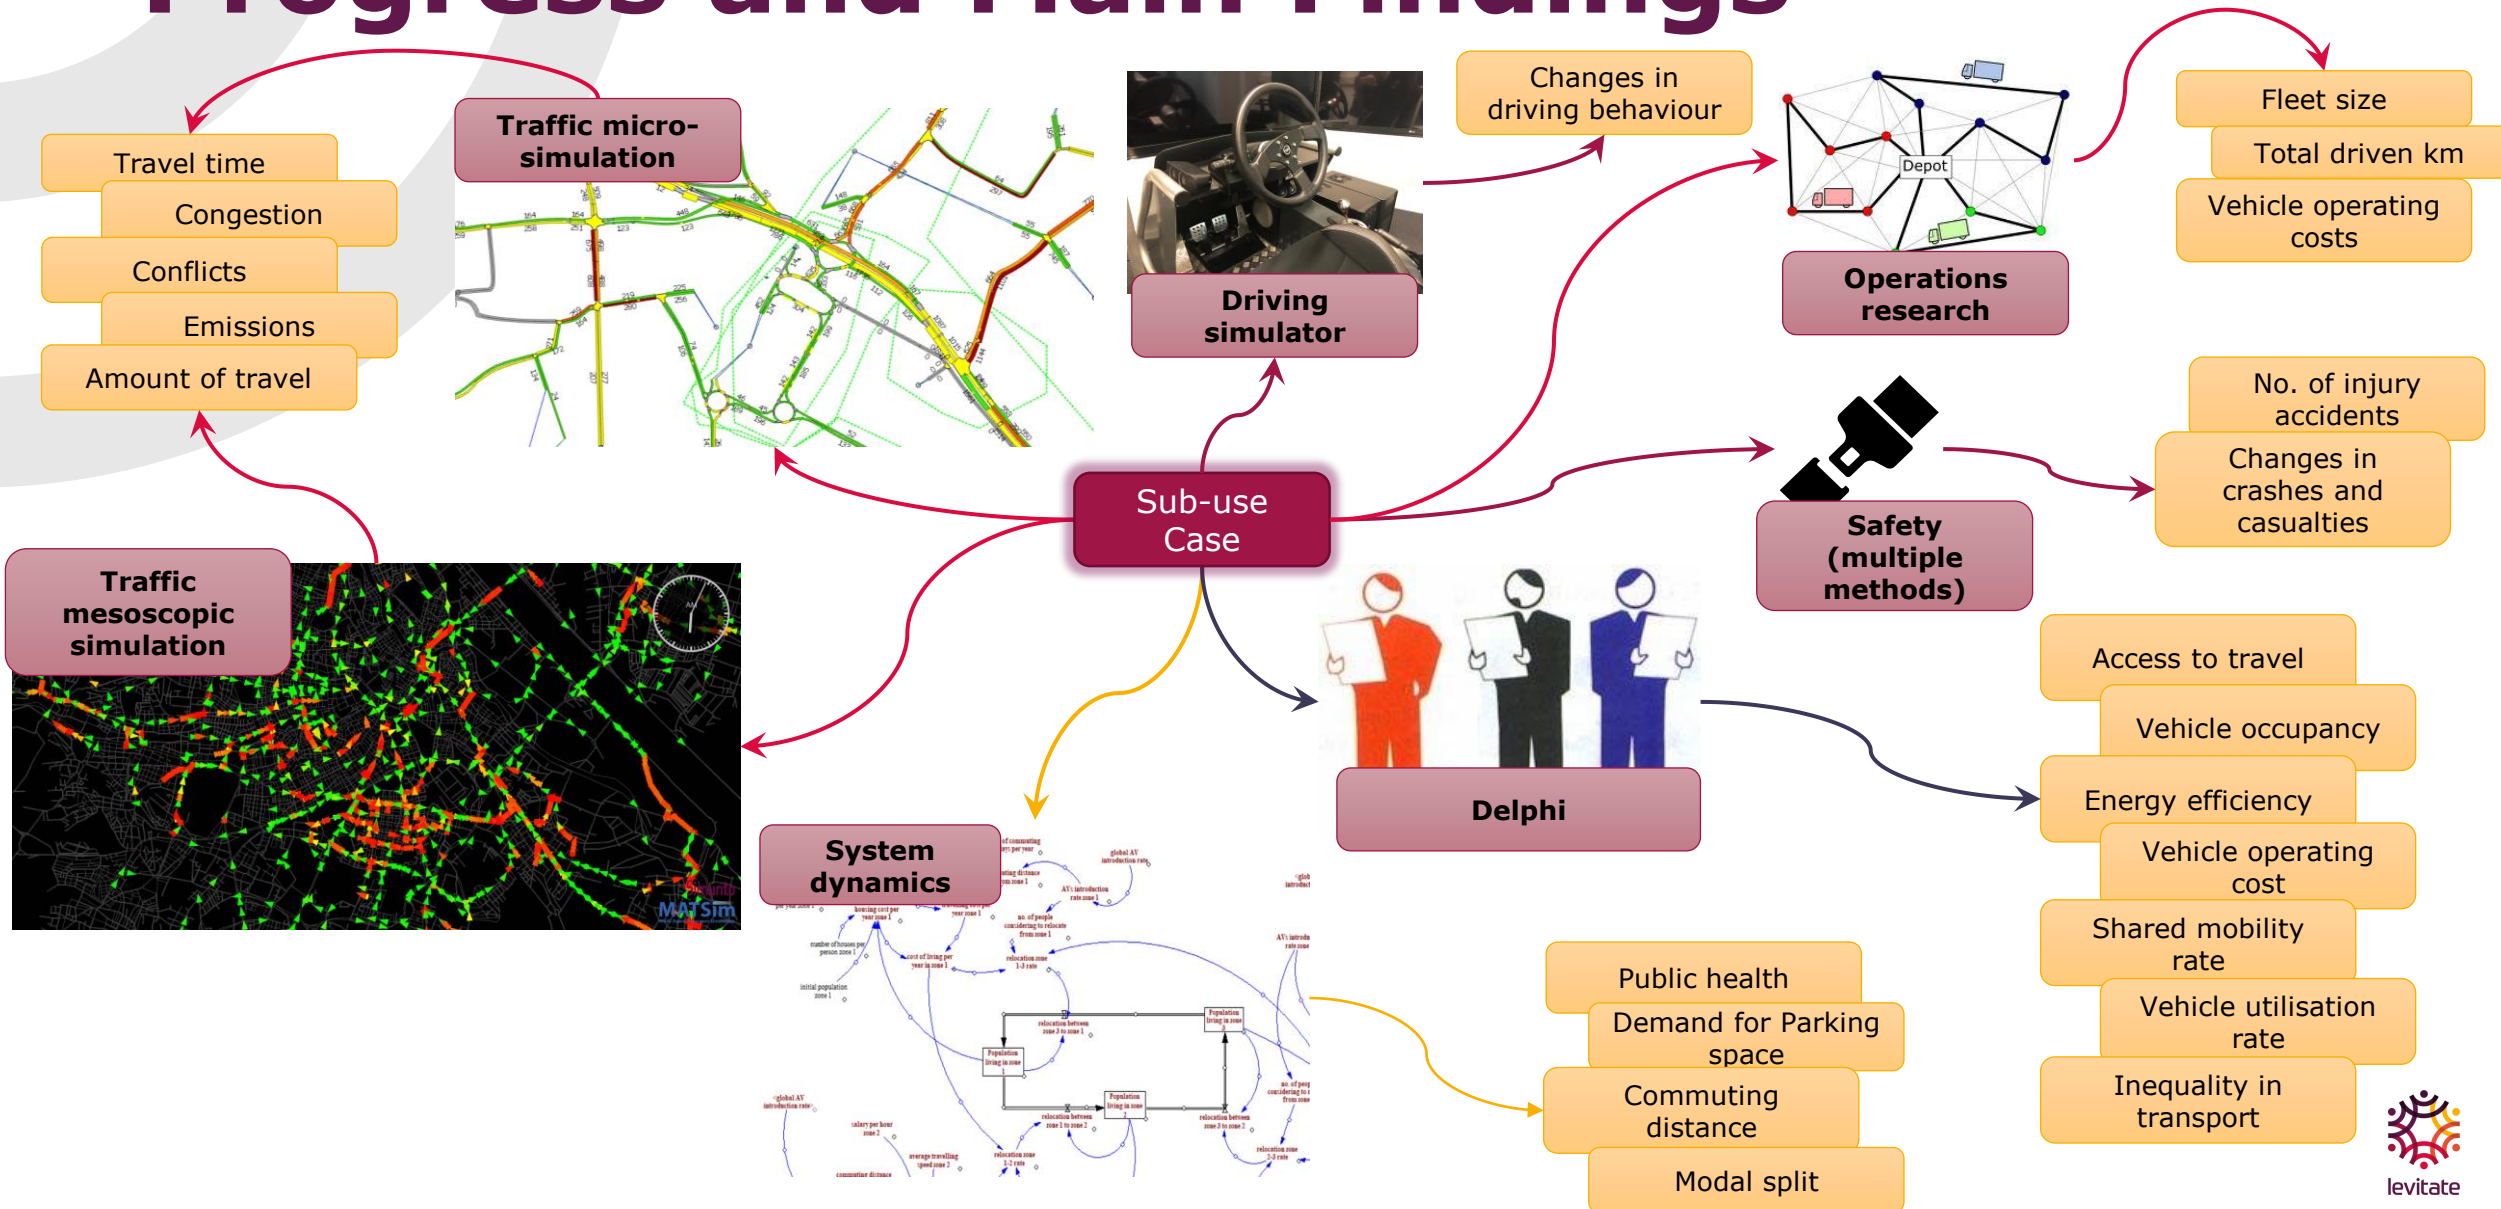

Project partners

Work plan overview

Progress and Main Findings

What the user gives:

1. Selection of automation use case (e.g. Park pricing)
2. Definition of initial parameter values (e.g. GDP per capita, inflation, city population)
3. Definition of scenario of automation penetration (neutral, pessimistic, optimistic)
4. Selection of sub-use case (e.g. parking ban, park outside, return to origin)
5. Selection of policy implementation year (from 2020 to 2050)

What policies can provide positive impacts from CATs?

- BIBLIOGRAPHY

ESTIMATOR MODULE

- FORECASTING
- BACKCASTING

3 USE CASES

FREIGHT TRANSPORT

PASSENGER CARS

URBAN TRANSPORT

14 SUB-USE CASES

ROAD USE PRICING

AUTOMATED URBAN
FREIGHT DELIVERY

STATION TO STATION
AV SHUTTLES

AUTOMATED
RIDE SHARING

20 IMPACTS

PUBLIC HEALTH

COMMUTING
DISTANCES

ROAD SAFETY

VEHICLE
UTILIZATION RATE

23 PARAMETERS

ELECTRICITY
COST

VEHICLE
OWNERSHIP RATE

CITY
POPULATION

FUEL
CONSUMPTION

What the user gets:

- A) Systemic impacts, such as:
1. Amount of travel
 2. Congestion
- B) Wider impacts, such as:
1. Road safety
 2. Pollutant levels due to vehicles (NOx, CO2, PM10)
 3. Commuting distances

Prediction of impacts based
on your selection

WP Aims and Objectives

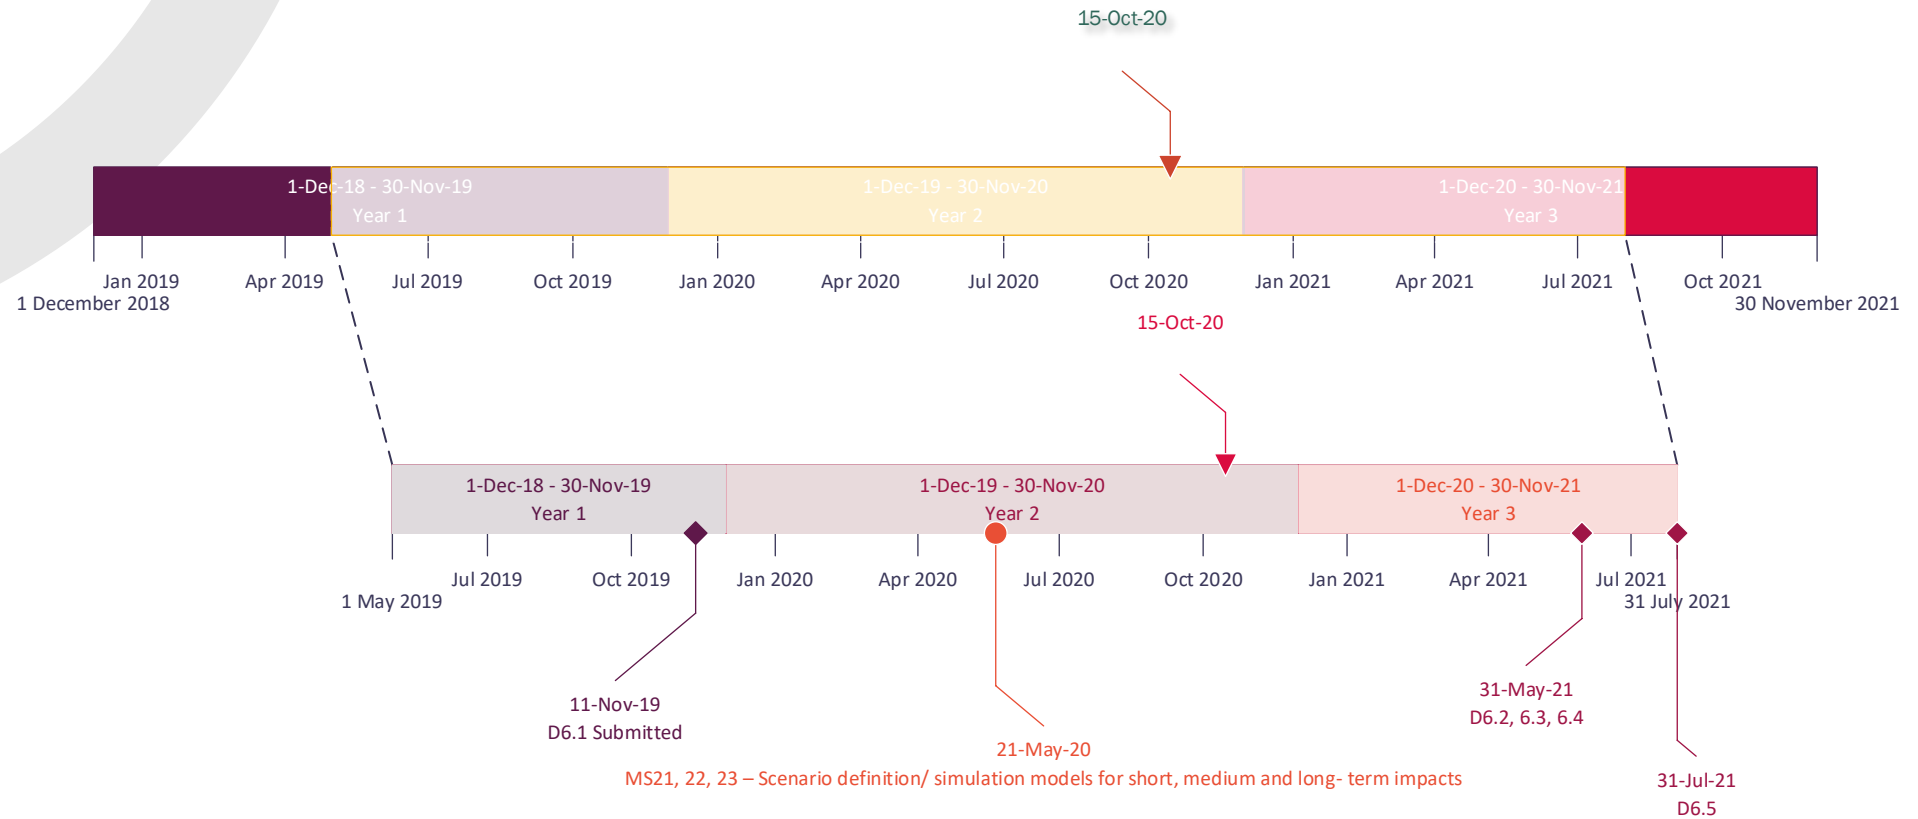

Aim

Forecast short-, medium- and, long-term impacts of automated passenger cars on safety, mobility, environment, economy and society.

Objectives

- Define **passenger car sub-use cases**
- Identify **methods and impact KPIs** for sub-use cases
- Operationalise the **methods** for impact assessments
- **Forecast** impacts from sub-use cases

WP Timeline

Sub-use cases

- Road use pricing
 - Empty km pricing
 - Static toll on all vehicles
 - Dynamic toll on all vehicles
- Automated ride sharing
- Parking space regulation:
 - Parking price
 - Replace on-street parking with public space
 - Replace on-street parking with driving lanes
 - Replace on-street parking with pick-up/drop-off parking
- Provision of dedicated lanes for AVs on urban highways
- Green Light Optimal Speed Advisory (GLOSA)

Impact assessments

Challenges

- Assumptions regarding cautious and aggressive driving behaviour
 - ✓ Phase wise entry of automated vehicle fleet
- Changes in human behaviour (choice)
 - ✓ Input required by the user

Parking behaviour

Scenarios

Enter and park inside the area

Enter, drop off (30 seconds) and return to origin to park

Enter, drop off and return to outside parking to park

Enter and drive around (short stay)

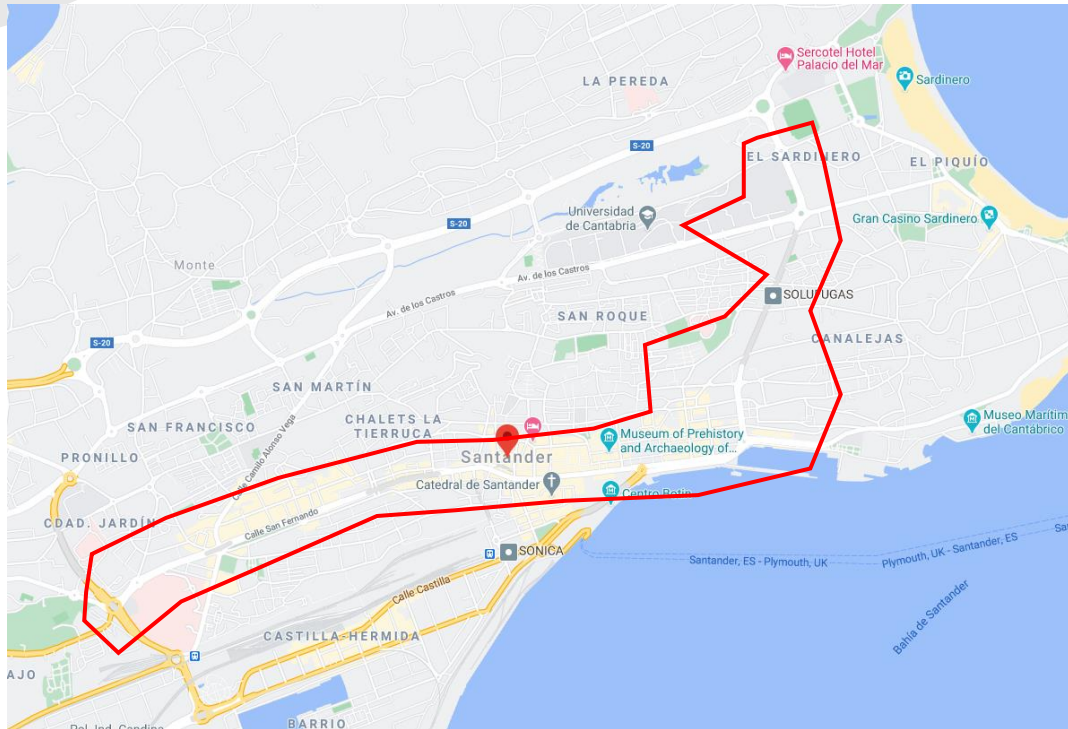

Drop off and return to origin (origin inside the area)

	Return to Origin %	Park Outside %	Drive around %	Park Inside %
Baseline	0%	0%	0%	100%
Case 1 (balanced)	22%	45%	20%	13%
Case 2 (Heavy drive around)	0%	0%	100%	0%
Case 3 (Heavy Return to origin and Park outside)	33%	67%	0%	0%

Parking behaviour

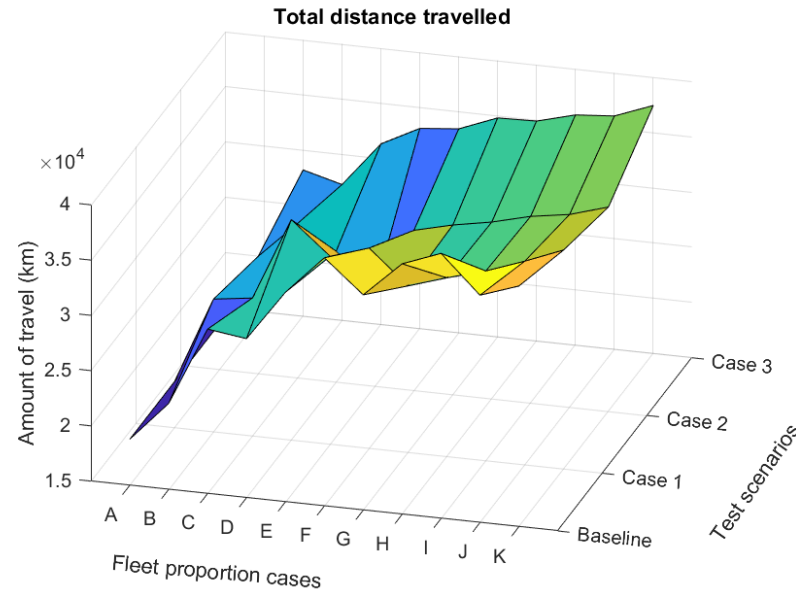

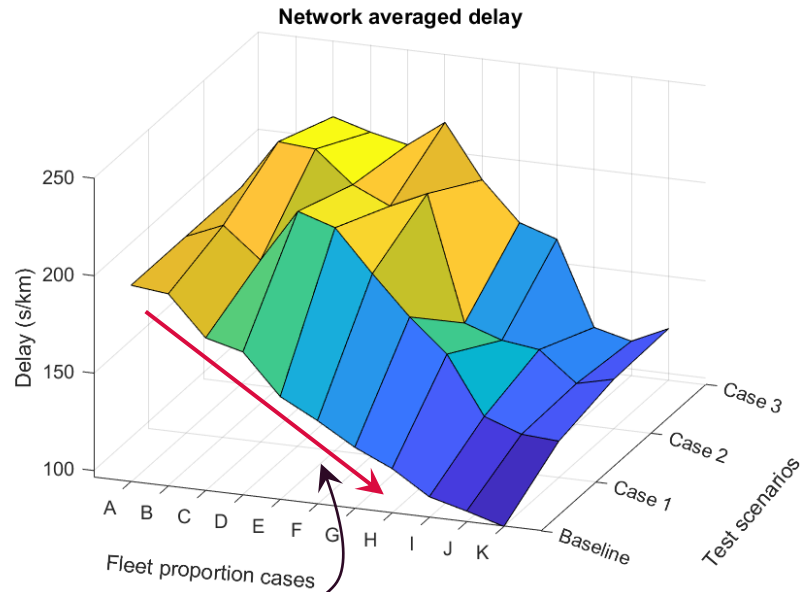

Network

AIMSUN (**A**dvanced **I**nteractive **M**icroscopic **S**imulator for **U**rban and Non-Urban **N**etworks)

Parking behaviour

Results

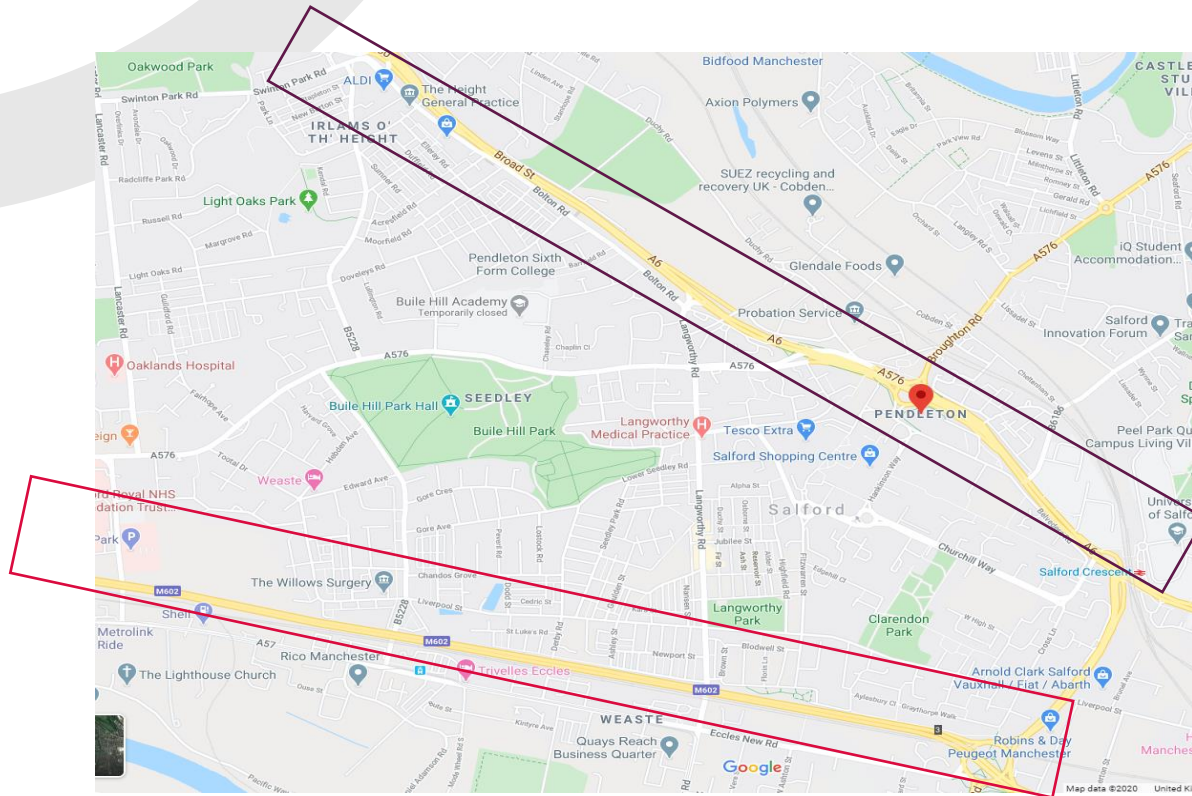

Vehicle electrification

Increase in capacity

	Return to Origin %	Park Outside %	Drive around %	Park Inside %
Baseline	0%	0%	0%	100%
Case 1 (balanced)	22%	45%	20%	13%
Case 2 (Heavy drive around)	0%	0%	100%	0%
Case 3 (Heavy Return to origin and Park outside)	33%	67%	0%	0%

Provision of dedicated AV lanes

Scenarios

Greater Manchester

Dedicated lane for AVs

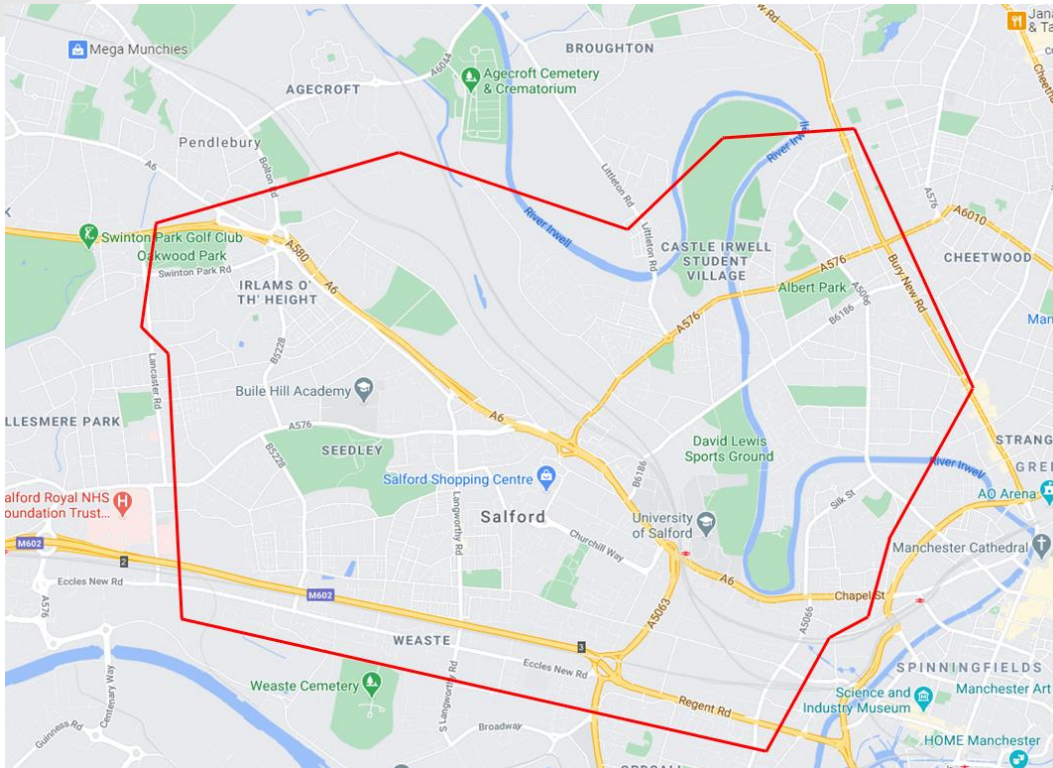

- Baseline scenario – no dedicated lane
- Motorway (outermost) – dedicated lane on a motorway outermost lane
- Motorway (innermost) – dedicated lane on a motorway innermost lane
- Motorway and A road – dedicated lane on a motorway and A road (outermost)
- Dynamic control – dedicated (outermost) lane however, the lane is AVT with dynamic control of lanes

Provision of dedicated lanes

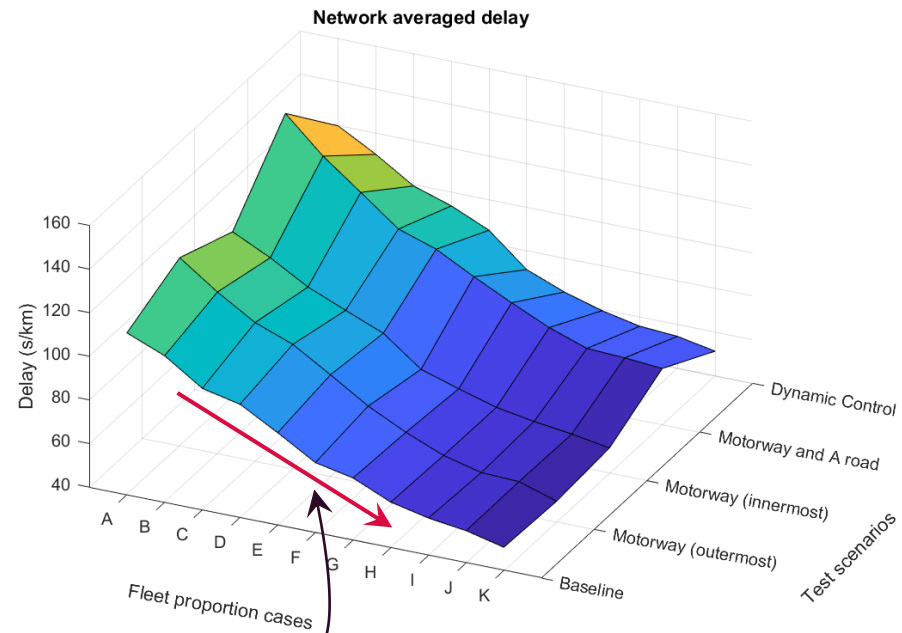

Network

AIMSUN (**A**dvanced **I**nteractive **M**icroscopic **S**imulator for **U**rban and Non-Urban **N**etworks)

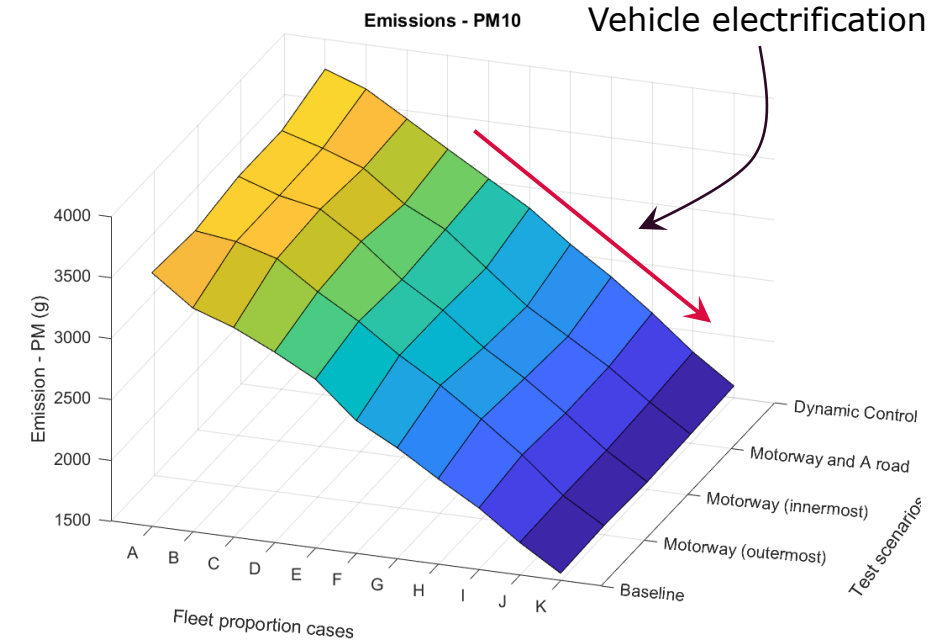

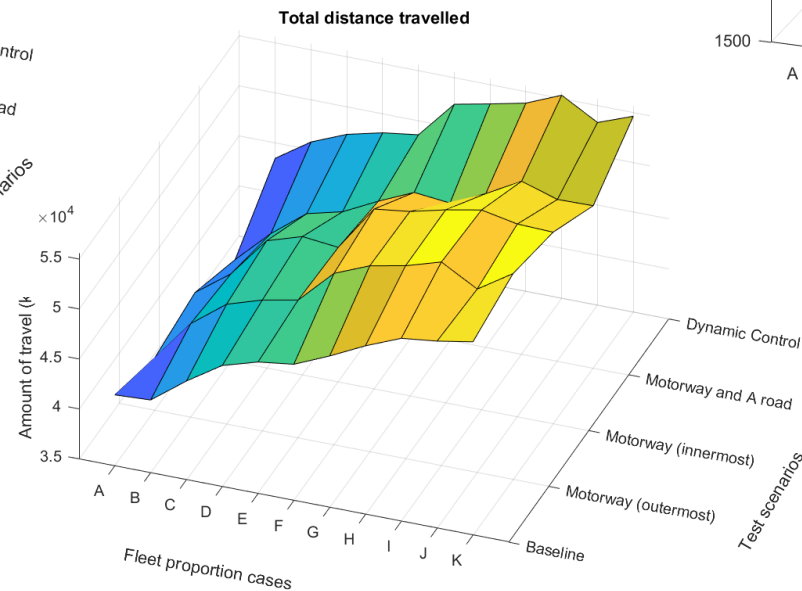

Provision of dedicated lanes

Results

Increase in capacity

Discussions

- Increase in delay and decrease in total travel caused by heavy drive around scenario → expected due to more congestion build up.
- Dedicated lane could benefit more in highway settings rather than urban settings due to intersections and merging lanes.
- Authorities can use the results to navigate through policy landscape to harness positive benefits from new technologies/transport modes.
